

SULAIMON EKUNDAYO

DATA ENGINEER CONSULTANT

sulaimon.ekundayo1@gmail.com • +358 440255576

PROFILE

I am a Data Engineer with 5+ years of hands-on experience designing and delivering scalable ETL/ELT pipelines, data models, and analytics-ready datasets for product and business teams. I specialise in SQL-led data modelling, Python-based pipeline development, and cloud data platforms, and I have actively used Airflow and AWS services to automate, schedule, and monitor batch workflows.

I focus on building reliable data foundations that enable subscription and advertising reporting, working closely with analysts and data scientists to deliver fit-for-purpose datasets. At AMADARI I redesigned batch pipelines and implemented data validation checks that reduced processing time by 30% and improved data accuracy, enabling faster reporting and saving an estimated 10k GBP per quarter.

CORE SKILLS

Stakeholder management and requirements translation for analytics and reporting • Cross-functional collaboration with data analysts and data scientists • Ownership of end-to-end data pipeline delivery and operations • Data quality governance, testing, and validation strategies • Problem-solving and root-cause analysis for data incidents • Data modelling and schema design for analytics consumption • Documentation, standards, and best-practice evangelism • Delivery prioritisation and project coordination in fast-paced teams

TECHNICAL SKILLS

SQL for data modelling and transformations (complex joins, window functions) • Python for ETL/ELT and Airflow DAG development • Apache Airflow for orchestration, scheduling, and monitoring • Snowflake and cloud data warehouse patterns (clustering, micro-partitions) • dbt and data transformation frameworks for tested models • AWS (S3, Lambda, ECS, RDS) for ingestion, storage, and compute • Streaming basics (Kafka) and batch-to-stream design patterns • Monitoring and alerting (Prometheus, Grafana, Airflow sensors) and CI/CD

EXPERIENCE

AMADARI (Jan 2026 - Present)

Data Engineer Consultant

- Redesigned batch ETL pipelines using Python and Airflow to improve processing throughput, reducing end-to-end pipeline run time by 30% and enabling same-day analytics delivery.
- Implemented dbt-style transformation patterns and modular SQL models to standardise data modelling, increasing model reusability and reducing development time by 25%.
- Optimised cloud storage and data warehouse layouts using Snowflake best practices (micro-partitions and clustering), lowering storage costs and saving approximately 10,000 GBP per quarter.
- Built automated data validation tests and monitoring alerts (Airflow sensors and Prometheus) to detect schema drift and data quality issues, cutting incident resolution time by 40%.
- Led cross-functional delivery with analysts and product owners to produce subscription and advertising reporting datasets, delivering 10 projects on time and increasing stakeholder satisfaction by 20%.

Tutors Finland Oy (Aug 2024 - Nov 2025)

Software QA Engineer

- Developed Python automation suites and integrated tests into CI/CD pipelines to validate ETL output and database migrations against PostgreSQL and MySQL, reducing regression cycles by 70%.
- Designed and executed data integration tests that verified data accuracy for reporting pipelines, using SQL to validate transformations and detect schema drift before release.
- Collaborated with data analysts and backend engineers to model reporting tables and prepare transformed datasets that supported business analytics and product KPIs.
- Introduced monitoring checks and alerting for critical data jobs in Airflow, improving visibility and reducing unnoticed failures by 60%.
- Coached engineers on test-driven data development practices and data quality checks to raise overall pipeline reliability.

Autoflow (Jan 2022 - Jul 2024)

Software QA Engineer

- Built automated end-to-end and integration tests in Python and Robot Framework, integrating them into CI/CD to increase deployment confidence for data-related releases.
- Implemented ETL validation and SQL-based checks to surface data anomalies and schema drift prior to production, preventing high-impact data incidents.
- Worked with engineers to optimise PostgreSQL queries and implement partitioning strategies that reduced heavy reporting query times by up to 35%.
- Supported near real-time data use-cases by developing lightweight Kafka ingestion prototypes and designing batch-to-stream handoff patterns to lower data latency for analytics consumers.
- Collaborated with stakeholders to translate reporting needs into table designs and transformations used by analysts and BI tools.

INITS Limited (Sep 2020 - Dec 2021)

Software Test Engineer

- Executed manual and automated tests for web and mobile applications while supporting data migration projects with SQL verification across MySQL and PostgreSQL.
- Authored queries and validation scripts to confirm data integrity during releases, reducing post-release data defects by 30%.

EDUCATION

INFORMATION AND COMMUNICATIONS TECHNOLOGY May 2025

Business College Helsinki

CERTIFIED TESTER, FOUNDATION LEVEL (CTFL) - ISTQB Dec 2022

Association for Testing and Software Quality Assurance (ATSQA) - USA

MASTER OF SCIENCE IN ECONOMICS AND BUSINESS ADMINISTRATION - FINANCE Sep 2015

Oulu Business School, University of Oulu
